First Results of D(e,e'p)n Electro-Disintegration Experiment at Very High Recoil Momenta

Graduate Student: Carlos Yero

Spokespeople: Drs. Werner Boeglin and Mark Jones

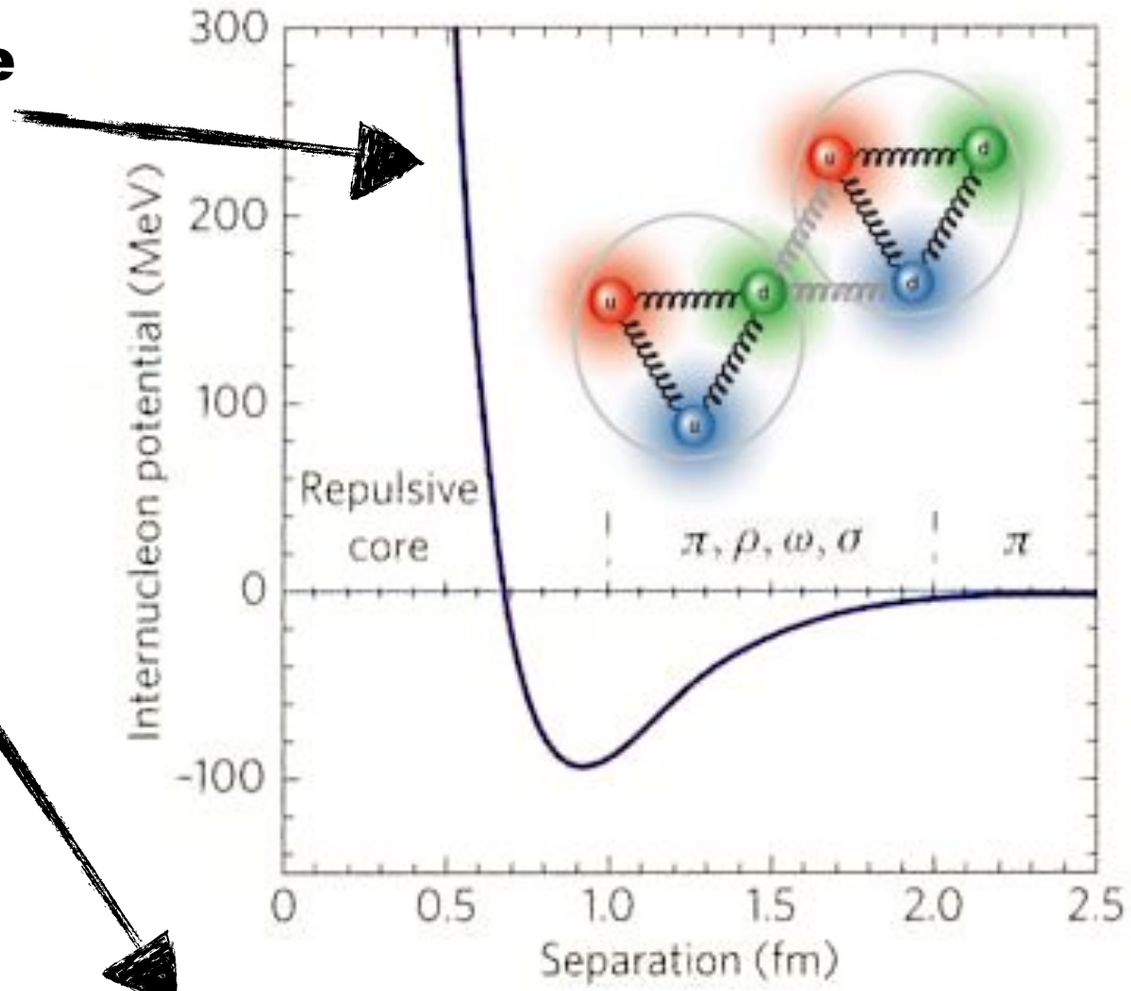
Jefferson Lab
Exploring the Nature of Matter

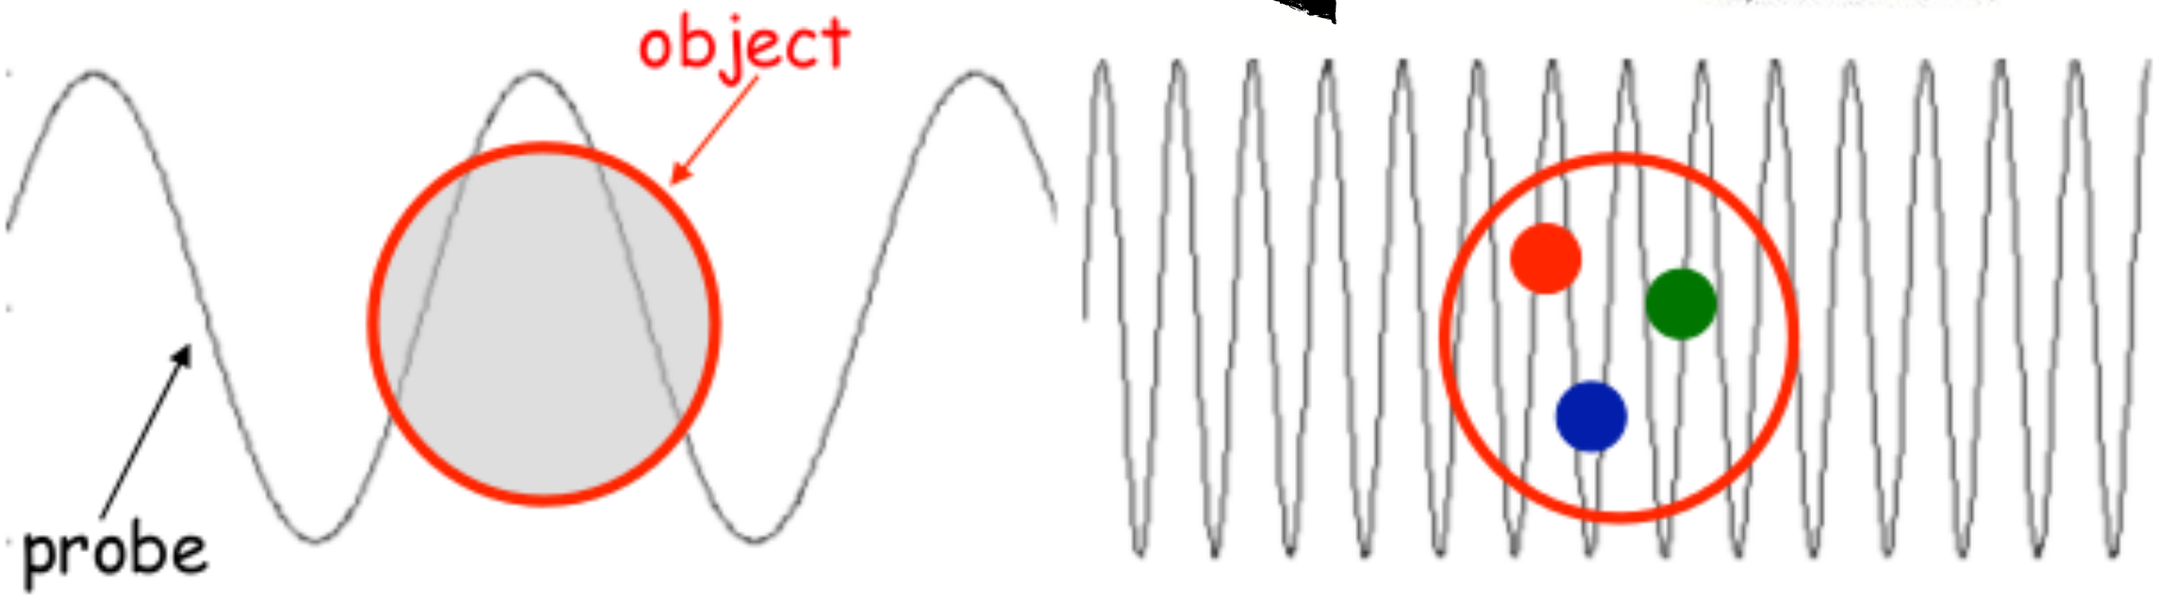
FIU

Hall C

Motivation

- ☑ **Understand the short range structure of the Deuteron by probing its high momentum tails**
- ☑ **Use D(e,e'p)n reaction to probe sub-fermi distances using high momentum transfer (Q2)**
- ☑ **Extract momentum distributions beyond 500 MeV/c recoil momenta**



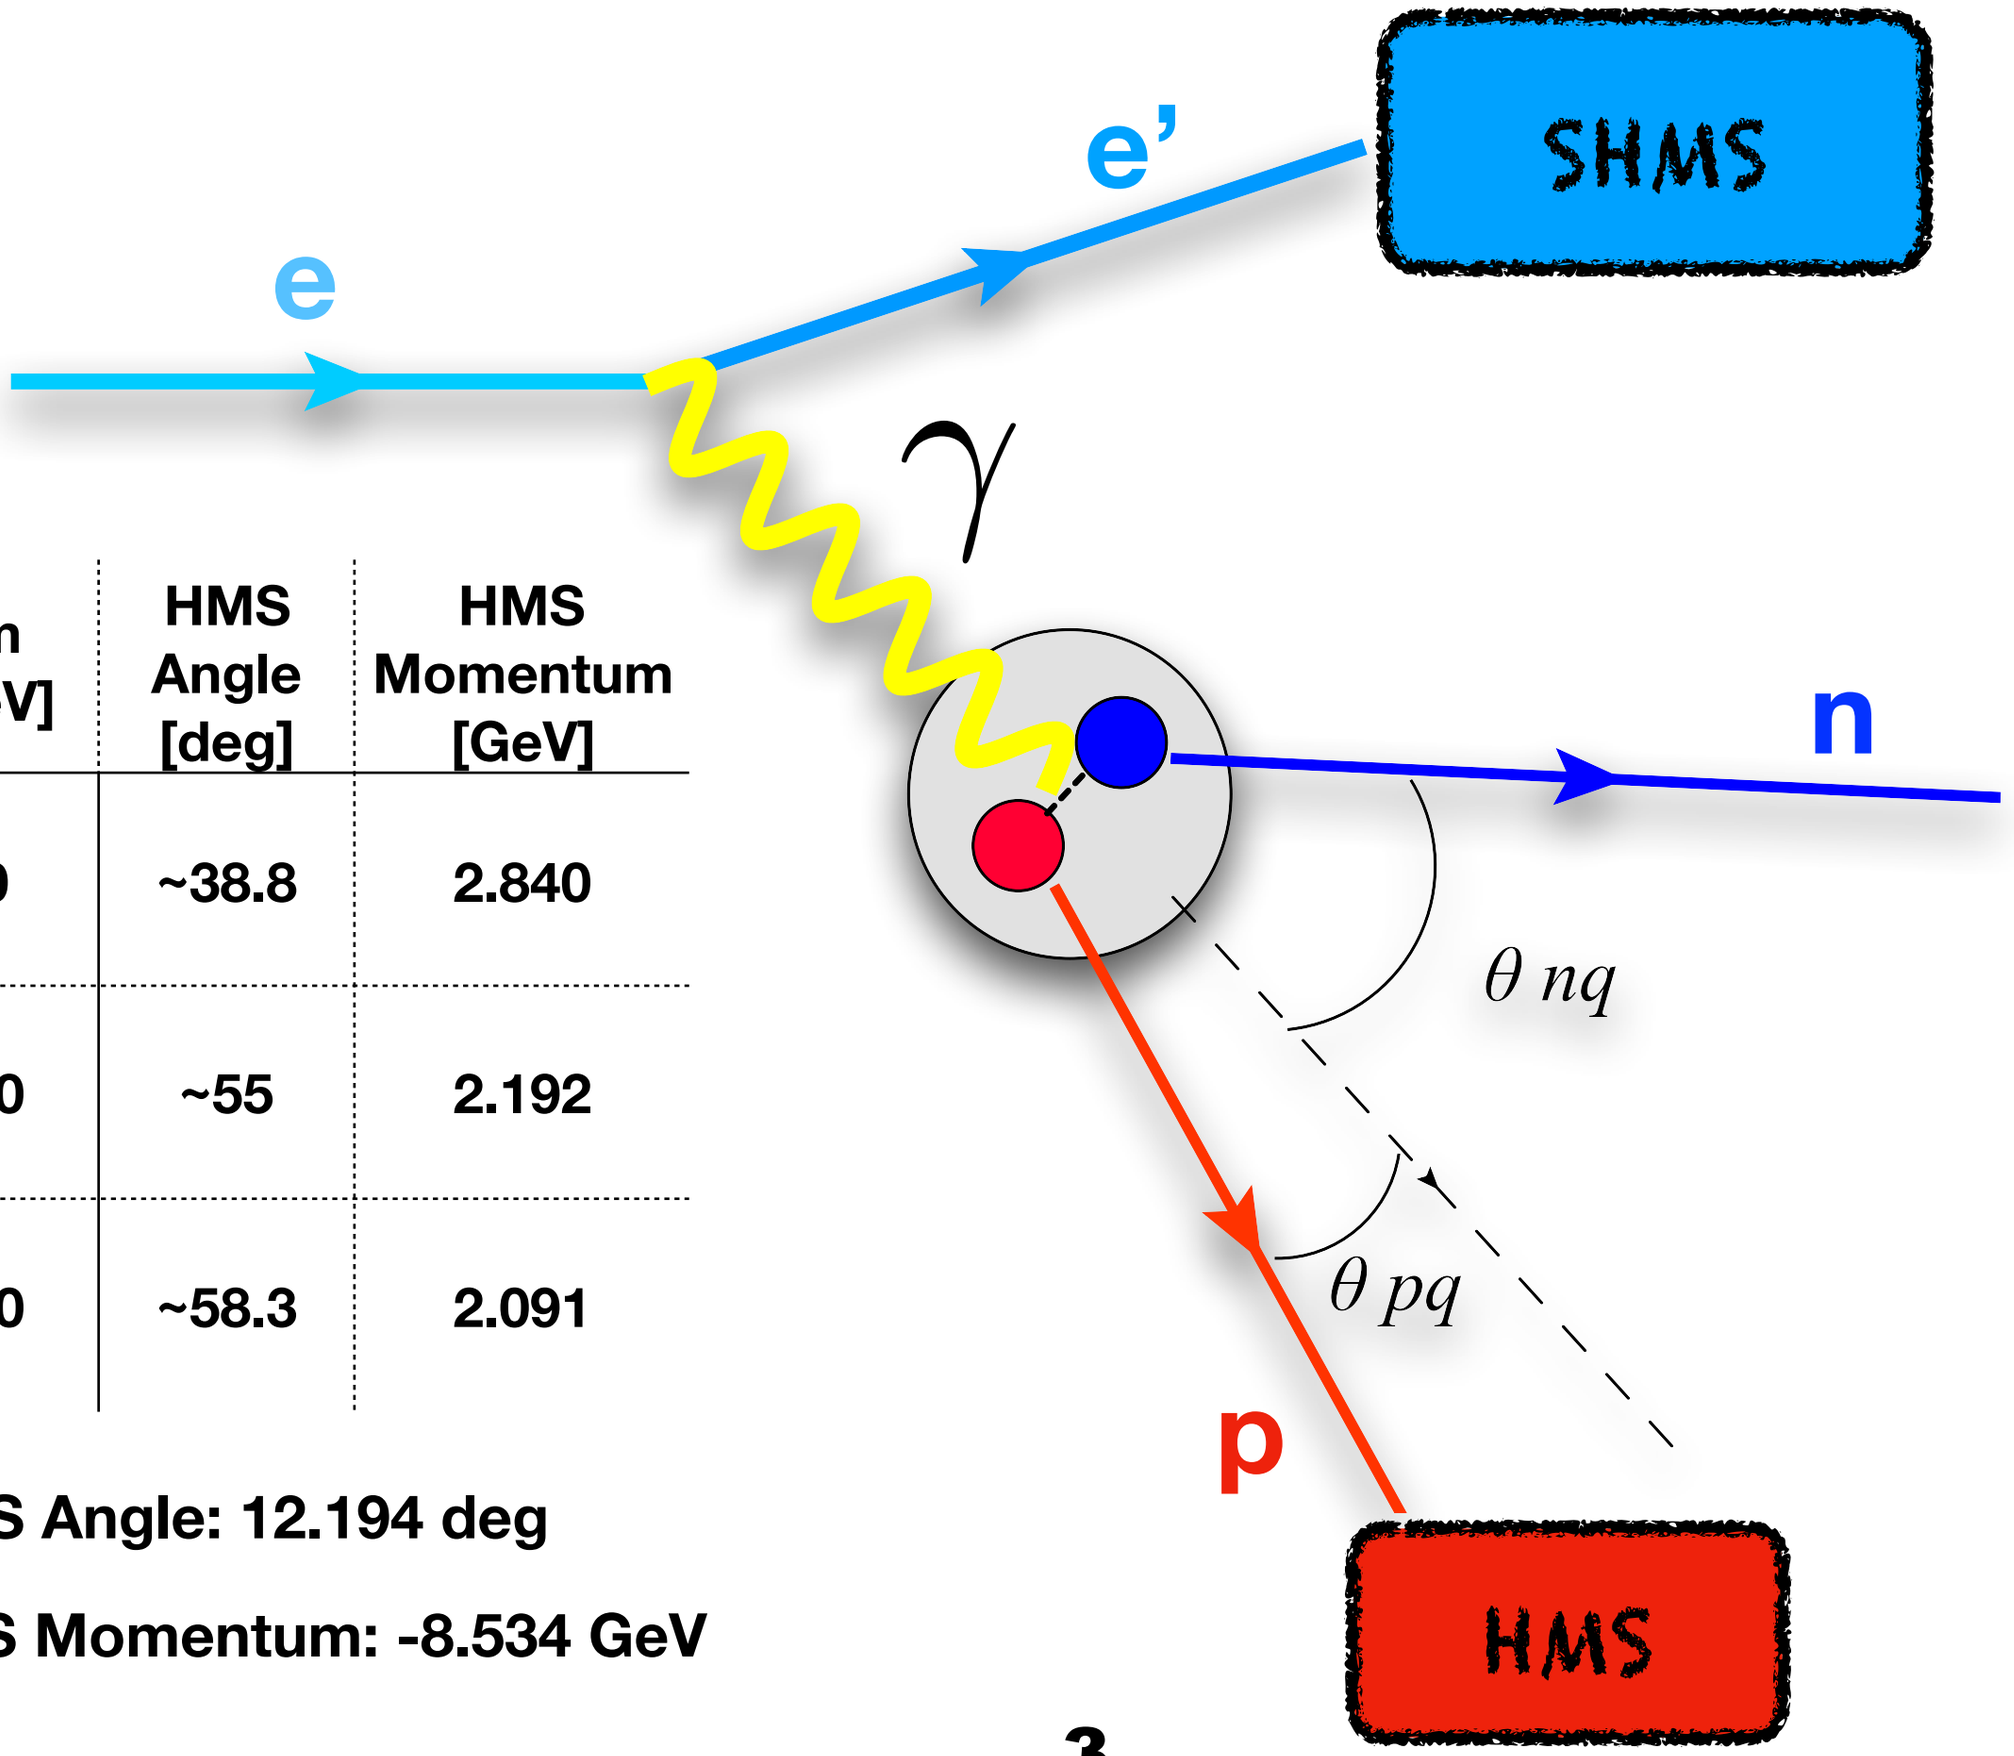


Kinematics

Pm [MeV]	HMS Angle [deg]	HMS Momentum [GeV]
80	~38.8	2.840
580	~55	2.192
750	~58.3	2.091

SHMS Angle: 12.194 deg

SHMS Momentum: -8.534 GeV



Theoretical Background for D(e,e'p)n

D(e,e'p)n Kinematics

$E_e = 11$ GeV

$Q^2 = 4.25$ (GeV/c)^2

$x_{B_j} = 1.35$

$p_m = 0.5 - 1.0$ GeV/c

$\theta_{nq} = 35^\circ - 40^\circ$

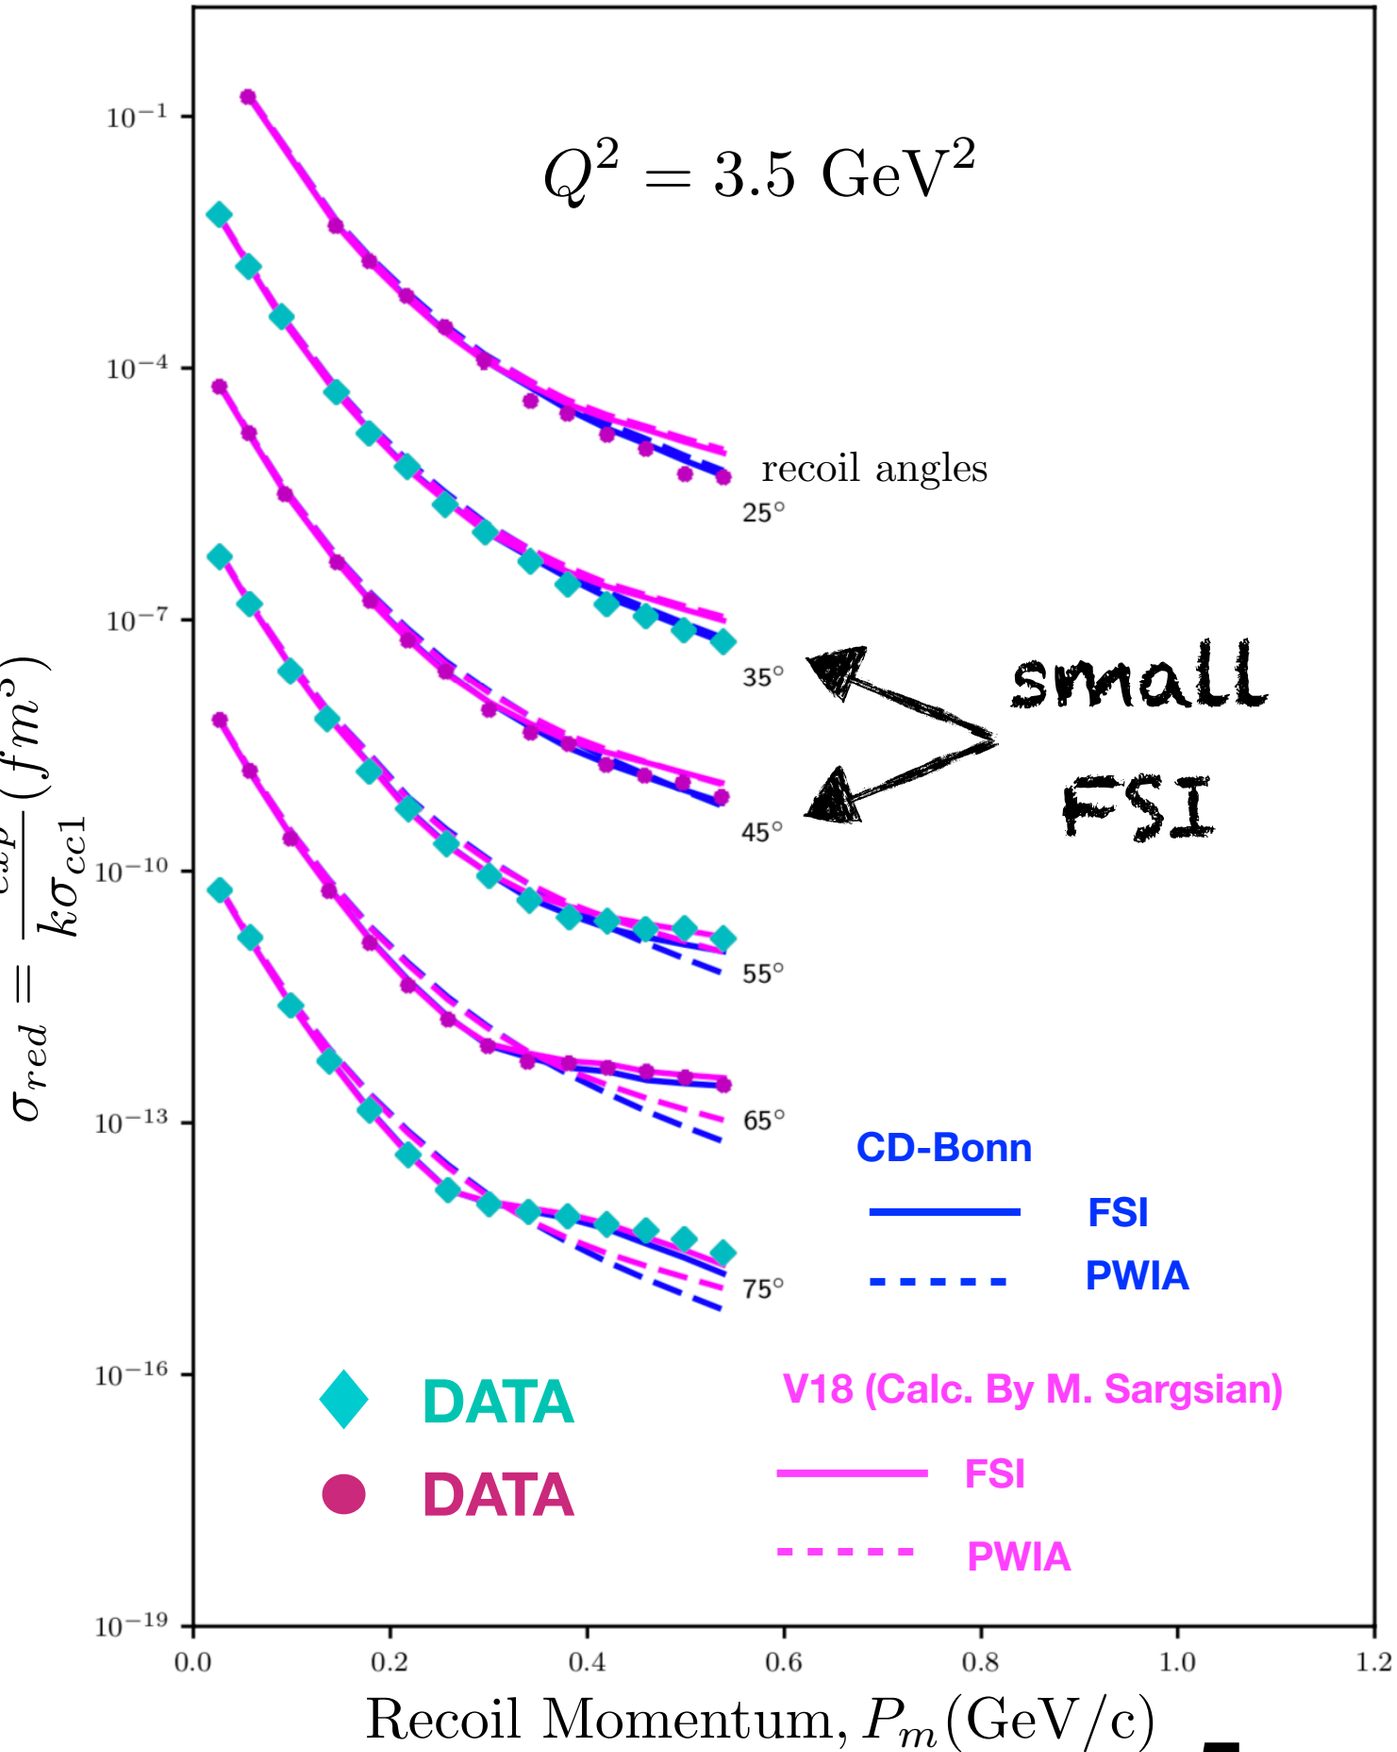
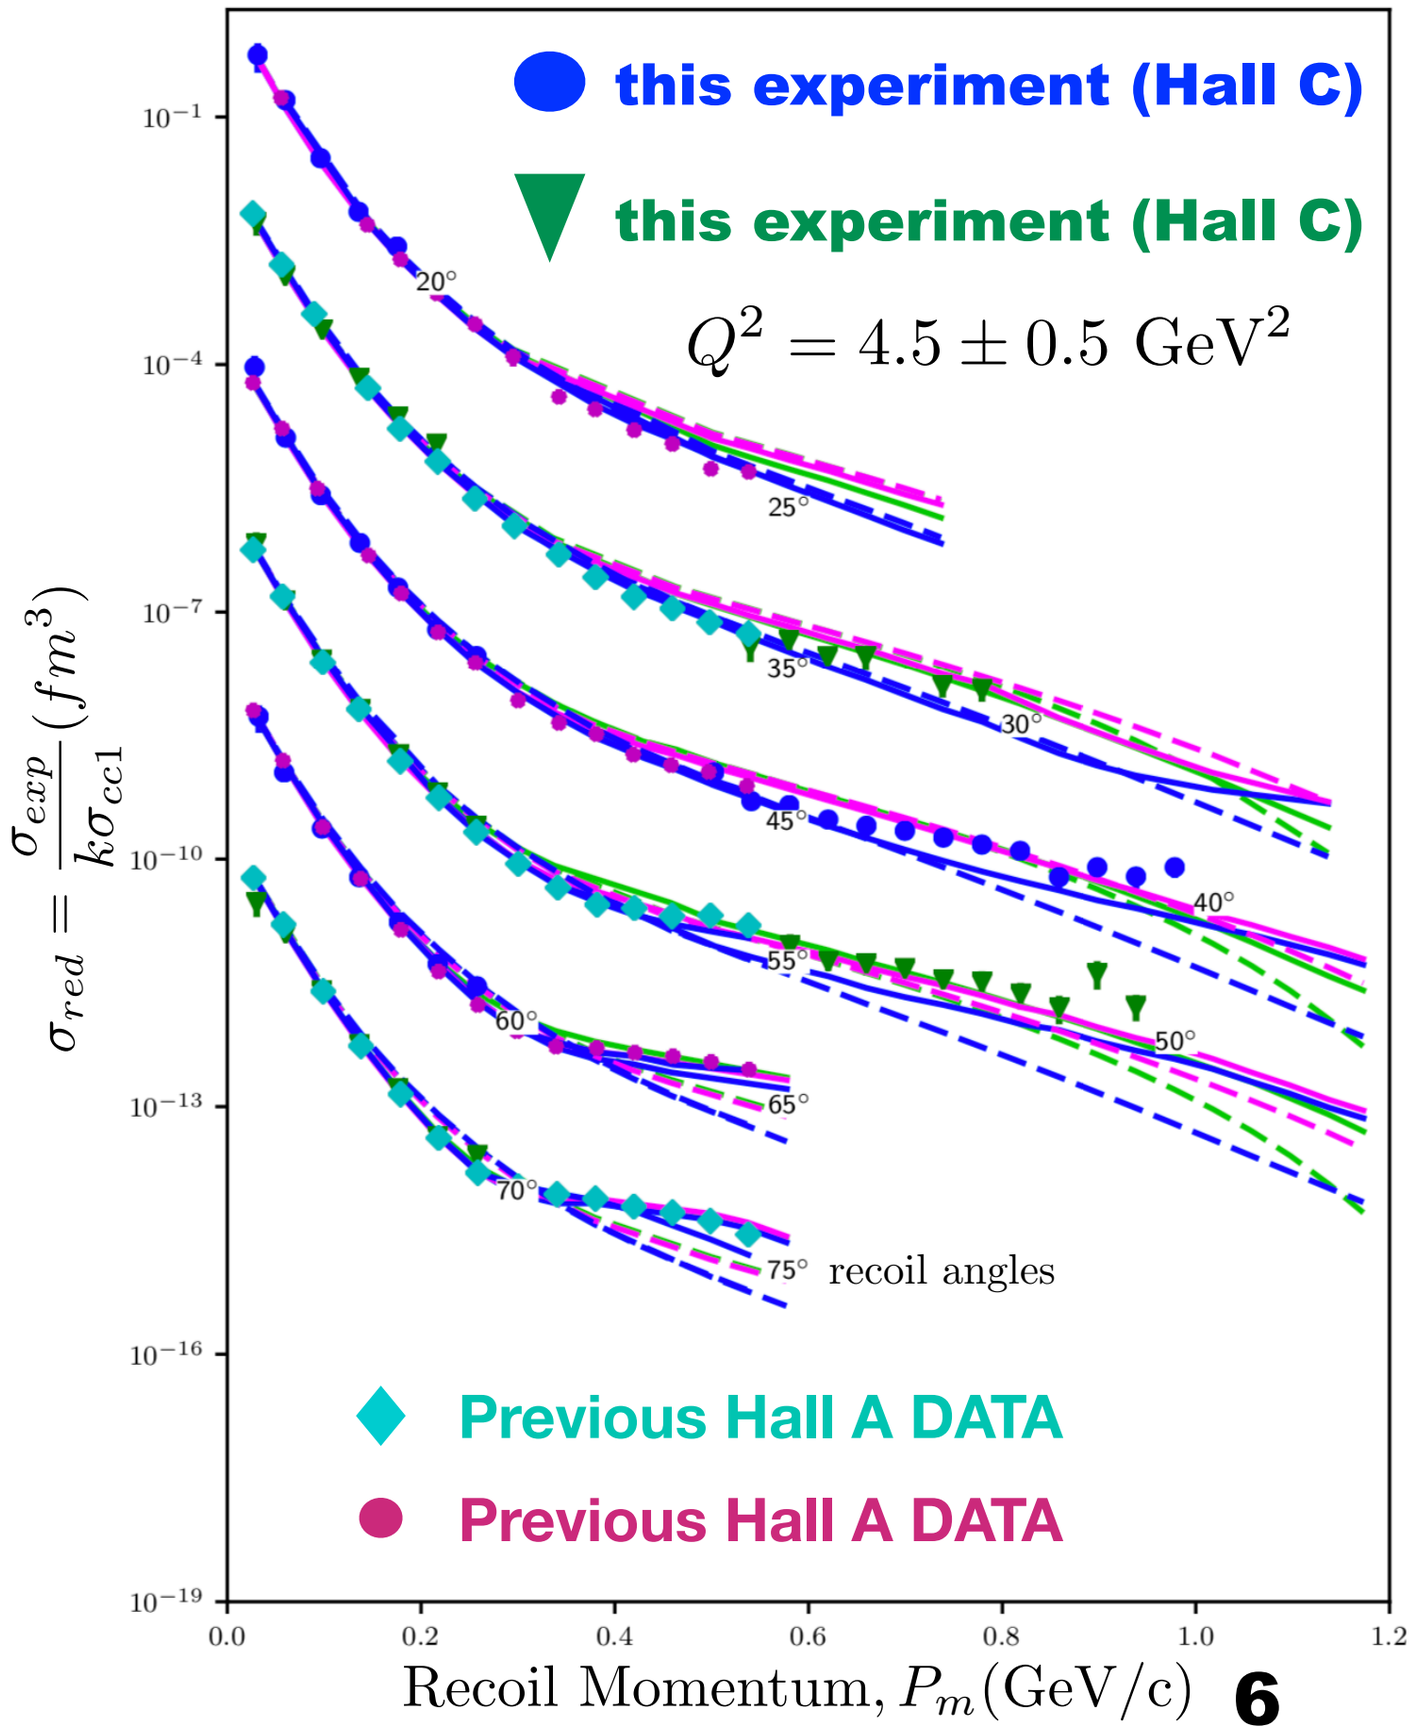
Previous Hall A Measurement of D(e,e'p)n



- ☑ **Momentum Distribution at various recoil angles are scaled relative to the 25 deg. setting**
- ☑ **At recoil angles 40 +/- 5 deg, is a kinematic region of interest as FSI are suppressed**
- ☑ **Deuteron Momentum Distribution becomes accessible at small FSI**

Preliminary Results for this Experiment !



CD-Bonn Potential
(Calculation by M. Sargsian)

FSI

PWIA

Argonne V18 Potential
(Calculation By M. Sargsian)

FSI

PWIA

Paris Potential
(Calculation by J.M. Laget)

FSI

PWIA

SUMMARY

- **This experiment (commissioning) ran for 3 PAC days (6 days total) out of the approved 21 PAC days.**

- **Preliminary results shows reasonable agreement with previous Hall A data at low recoil momenta**

- **At high recoil momenta, the data are NOT well described by either models.**

Very interesting results at high missing momentum with ONLY 6 days of beam time, as data does NOT seem to be well described by theory in small FSI region ! ! !
